Supabase per user

Built for a simple trading workflow: sign in, configure your setup, record trades quickly, and review performance without clutter.

App Overview

TRADERS HUB combines a trade tracker, position size calculator, and analytics dashboard in a single app.

1. Login Enter passcode	2. Configure Set markets, symbols, accounts	3. Track Add trades and discipline	4. Review Use dashboards and filters
-----------------------------------	---	--	--

Trade Tracker

Add trades with market type, symbol, session, account, strategy, size, outcome, amount, entry, exit, points, discipline, and notes.

Dashboards

Review overview metrics, account balances, equity curve, analytics, weekly/monthly performance, and strategy breakdowns.

Position Size Calculator

Calculate lots or contracts from account size, risk, stop loss, and value per point.

User-Specific Setup

Each user can keep their own symbols, sessions, accounts, strategies, market types, and account balances.

Getting Started

Before you can use TRADERS HUB, you need a passcode. This will be provided to you. The passcode gives you access to your own trading workspace, where your setup and trades are saved against your account.

Step 1: Enter Passcode	Type the passcode you have been given and select Unlock. If it is accepted, the app opens and starts loading your saved data.
Step 2: Check Setup	If you are new, the setup wizard opens automatically. If you have already configured the app, your dashboard and trade table load straight away.
Step 3: Configure First	Add the values you want to see in the trade form. This prevents the form being filled with options that are not relevant to your trading.
Step 4: Start Tracking	After setup is saved, Add Trade becomes active. You can then begin recording trades and reviewing performance.

Initial Setup Flow

The first setup is important because it controls the dropdowns, account balance cards, dashboard filters, and the fields shown when adding a trade.

Market Types CFD, Futures, or both	Symbols The instruments you trade
Sessions Optional time-of-day tracking	Accounts Accounts and starting balances
Strategies Your trade setup names	Save Unlock Add Trade

Why setup matters	The app is designed to be personal to each trader. If you only trade Futures, the app can focus on contracts. If you trade CFDs, it can focus on lots. If you trade both, both sizing views can be used.
What happens after setup	Once setup is saved, the Add Trade button becomes available. Your selected values then appear in the trade form and filters.
Changing setup later	Use the Configure button if your symbols, accounts, strategies, sessions, or balances change. Existing trades remain in the journal.

First-Time Setup

The setup wizard walks through each input independently. The aim is to build a clean, useful trade form for your own trading style.

1. Market Types	Select CFD, Futures, or both. This tells the app whether trades should use lots, contracts, or both. Market type is asked first because it affects symbol setup and size tracking.
2. Symbols	Add the symbols you trade. Examples might be XAUUSD, NAS100, ES, NQ, or any symbol naming you use. If both market types are selected, add symbols under the relevant market type.
3. Sessions	Choose whether session tracking is useful. If it is, select only the sessions you want to review later. If sessions do not matter to your strategy, skip them.
4. Accounts	Add the trading accounts you want to track. You can include starting balances so the account balance dashboard has a clear baseline.
5. Strategies	Add the strategy or setup names you want to select when logging a trade. Keep these names consistent so the strategy breakdown is meaningful.

You can update setup later from the Configure button. If no setup has been saved yet, Configure returns you to the guided setup flow.

Adding A Trade

The trade form is designed to keep the core fields quick while allowing richer detail when needed.

Core Details	Date, market type, symbol, session, account, strategy, size type, size, outcome, and amount.
Price Details	Direction, entry, and exit. When entry and exit are provided, the app calculates points automatically.
Discipline	Positive and negative discipline markers help separate clean trades from rule breaks.
Notes	Capture context, lessons, and reasons for entering or exiting the trade.

Recommended habit: add the trade as soon as it is taken, then edit it later with the final outcome, amount, exit price, points, and notes.

Reviewing Trades

The trade table stays visible while you use the dashboard tabs, making it easier to connect the summary numbers back to the individual trades.

Filters	Filter the table by symbol, account, strategy, and market type. Use filters when you want to review one part of your trading without changing the stored data.
Trade Details	Click a trade row to open the detail view. This shows the recorded fields, notes, price details, points, and discipline information.
Edit Trades	Use edit when a trade moves from pending to win or loss, or when you need to add the final amount, notes, or exit price.
Export CSV	Export your trade table when you want a spreadsheet copy for separate review or backup.

Dashboard Tabs

After trades have been added, the dashboard becomes the main review area. Each tab answers a different question about your trading.

Overview Totals and quick status	Account Balances Per-account performance	Equity Curve Progress over time
Analytics Win rate, P/L, discipline	Weekly / Monthly Time period review	Strategy Setup performance

Overview	Start here for a quick health check: total trades, total size, wins, losses, and overall amount.
Account Balances	Use this when you trade more than one account. It shows balance, P/L, trades, and win rate by account.
Equity Curve	Use this to see whether your results are trending up, down, or sideways as trades are closed.
Analytics	Use this for deeper review: win rate, profit factor, average result, best/worst day, points, and discipline.
Weekly / Monthly	Use this to compare trading periods. It helps highlight strong days, weaker weeks, and monthly consistency.
Strategy Breakdown	Use this to compare setups. Over time it shows which strategies are producing the best results.

Position Size Calculator

The calculator helps estimate size before placing a trade. It supports both lots and contracts depending on the selected market type.

Account Size	Enter the current account size. This is required because the calculator uses it to understand the size of the account being risked.
Risk Amount	Enter the amount you are willing to risk. For example, entering 10 means a 10 currency-unit risk, not 10 percent unless that mode is selected.
Stop Loss	Enter the stop loss distance in points.
Value / PT	Enter how much one point is worth for one lot or one contract. Your broker or trading platform usually shows this in contract specifications.
Result	The calculator shows the rounded size. For lots it rounds to the configured lot step; for contracts it rounds down to whole contracts.

Using Your Data

Your setup and trades are saved to your account so you can return to the same journal later.

Your Login Private access	Your Setup Markets, accounts, strategies	Your Journal Trades, notes, analytics
-------------------------------------	--	---

Configuration	Market types, symbols, sessions, accounts, strategies, and account balances are saved per user.
Trade Journal	Trades include outcomes, amounts, size, points, notes, and discipline details.
Review Tools	Filters and dashboard tabs help you review performance without changing the underlying trade data.

Tip: keep your trade notes short but useful. Focus on why the trade was taken, whether the plan was followed, and what you would repeat or avoid next time.
